

ZCell energy storage

**“ZCell can cope with a high heat environment,
which is not true of a lot of batteries”**

Google Engineering Director ANZ Alan Noble

Alan Noble's ZCell benefits

Prominent Australian technology executive Alan Noble required an all-season, highly reliable energy supply at his family-owned property near the South Australian town of Willunga, to guarantee water pumps would work on high fire-risk days in summer. Faced with a very high price to extend mains power across the hilly 100-hectare block, plus the expense of ongoing electricity bills, Mr Noble decided to deploy a more cost-effective off-grid energy storage solution based on two ZCell batteries from Redflow that can store 20 kilowatt-hours (kWh) of energy – eliminating power bills for the property entirely.

PROJECT OVERVIEW

- Location: Near Willunga, 47km south of Adelaide, South Australia
- ZCell installation partner: Off-Grid Energy Australia www.offgridenergy.com.au
- Storage: 2 x 10 kWh ZCell batteries www.zcell.com
- Inverter: 2 x Victron MultiPlus 48/5000 battery inverters
- Solar: 24 x 250-watt Tindo Solar panels 6 kilowatts peak (kWp)
- ZCell-based system cost less to install than the fee for connecting to the local power grid
- ZCell allows full daily energy discharge without any damage to the battery
- ZCell guarantees electricity supply for water pumps during high bushfire-risk days
- ZCell tolerates high-temperature days, unlike lithium-based alternatives
- ZCell takes up minimal space
- ZCell means receiving no mains power bills ever.

CASE STUDY

WILLUNGA
SOUTH AUSTRALIA

Alan Noble fires up ZCell for bushfire defences

Alan Noble, Engineering Director for Google Australia and New Zealand, installed a ZCell-based energy storage system at his Willunga rural property in South Australia in the middle of 2016. Integrated by Off-Grid Energy Australia, the system is powered by 24 Australian-made Tindo Solar panels on the roof of a large implement shed, connected by two Victron battery inverters.

Faced with a very high price to extend mains power from one corner of the property across the hilly 100-hectare block, plus the expense of ongoing electricity bills, Mr Noble decided to deploy an off-grid energy storage solution based on two ZCell batteries from Redflow that can store 20 kilowatt-hours (kWh) of energy. As well as costing a fraction of the price of installing mains power, the decision has eliminated power bills for the property entirely.

Mr Noble said he chose ZCell because of its flexibility, safety and affordability. “We wanted the flexibility to build anywhere on the site without having overhead power lines,” he said. “Secondly, we have power when we need it. If there is a bushfire here, we can power our pumps properly whereas electricity distributor SA Power Networks has a policy of actually shedding power during high bushfire-risk days, so precisely when you need the power, they shut it down. Without the ZCells, we’d be running around trying to fire up generators during hot days, which is not practical.

“Also, we want to make this property as automated as possible. I want it so we can move water automatically, based on the power to turn on pumps, to turn on sprinklers and turn on any fire defences. We can only do that if we have our own on-site power. Last, but not least, I really like the idea of being self-sufficient. The way I see it, grid power is getting more and more expensive, so this is an investment that in the long term is going to be worth it.”

Mr Noble said he had preferred Redflow’s ZCell zinc-bromine flow batteries over lithium-based alternatives for two reasons. “Firstly, ZCell can cope with a high heat environment, which is not true of a lot of batteries,” he said. “It does get hot here in the summer as the shed is not air-conditioned. Also, about having power when you need it most, I want to make sure my batteries are working on those extreme heat, high bushfire-risk days.

“The other benefit is that ZCell can just sit there. Conventional batteries don’t like being fully discharged. Longer term, that’s less of an issue, but over the next couple of years while we’re not living here full-time, it’s nice to know that I’m not going to destroy the batteries if they’re fully discharged. They’re also relatively compact batteries too, so they don’t take a lot of space. Ease of use is a nice factor with ZCell. It’s all very easily managed through the BMS (Battery Management System), both on-site and through the Internet.”

Redflow has also configured Mr Noble’s ZCell system to re-charge automatically from a zero state of charge without requiring an external source, such as a diesel genset. This capability is valuable where power is not required 100 per cent of the time – such as at weekend properties. ZCell batteries are unique in their ability to remain undamaged or unstressed after discharging all their energy, even for an extended period. By contrast, lithium-ion batteries are ‘bricked’ by total discharge.

About Redflow

Redflow’s unique zinc-bromine flow batteries are designed for stationary energy storage applications ranging from its **ZCell** residential battery to its scalable **ZBM2** batteries for industrial, commercial, telecommunications and grid-scale deployment. Redflow Limited, a publicly-listed company (ASX: RFX), produces high energy density batteries that are sold, installed and maintained by an international network of system integrators. Redflow batteries offer unique advantages including 100 per cent depth of discharge, tolerance of ambient temperatures as hot as 50 degrees Celsius and sustained energy storage of 10 kilowatt-hours (kWh) throughout their operating life.
